119 The Two Roads of Marketing

Perspective Book · https://kb.jeffreysummers.com/docs/119-the-two-roads-of-marketing/

Every marketing decision the independent operator makes sits on one of two roads. Not a spectrum. Not a sliding scale. Two roads, two philosophies, two compounding trajectories — and the operator is on one of them whether they know it or not.

Chain strategies are built on short-term transactions. Independent strategies must be built on long-term relationships. The chain has the scale, the marketing budget, and the loss-leader capacity to rent traffic indefinitely. The independent does not. The independent who tries to compete on the chain's road loses by design. The only road where the independent wins is the one the chain cannot buy its way onto.

Transaction Based Marketing

Transaction Based Marketing exists to maximize the number and size of transactions. It has no relationship with the Guest — no past, no present, no future. The Guest is a unit of revenue to be acquired, converted, and replaced when they leave. The tool is price. The mechanism is push. The offer goes to as many people as possible, as often as possible, for as much discount as the margin can absorb.

It works — once. The Guest comes in for the deal. They get the deal. They leave. The next time they need a reason to come back, they need another deal. A better one. The bar moves every time it gets cleared. The operator who started with a 10% coupon is running BOGO within two years — not because the Guest got greedier, but because the operator trained them to expect the deal as the price of their presence.

The drug does not get weaker. The dose has to get stronger just to produce the same effect. Every discount is the entry fee for the next one. Every promotion is the floor for the one that follows. The operator is not building traffic. They are renting it — at an increasing rate, on a lease that never ends and never builds equity.

The full cost of Transaction Based Marketing runs 10 to 20% of sales or higher when production costs, delivery costs, discount costs, and the [Lost Opportunity Tax] are counted together. That last item — the revenue that would have been realized at full price from Guests who would have

come anyway — never appears on the P&L. It is the invisible cost of the road. The operator who sees only the discount cost is reading one side of the ledger.

You become a commodity through Transaction Based Marketing. The Guest who came for the price leaves for the price. A competitor with a deeper discount takes them. The operation that built its traffic on transaction has no differentiation left when the transaction gets cheaper somewhere else. The price was the product. When the price moves, so does the Guest.

Deal loyalty is not real loyalty. The failure to translate transactions into brand loyal behavior is death-wish marketing — — because the death comes slowly, funded by the very promotions the operator believed were building the business.

Relationship Based Marketing

Relationship Based Marketing exists to maximize the value of the Guest relationship over time. It has no use for the transaction as the primary unit of measurement — the transaction is evidence that the relationship is working, not the goal the marketing is chasing.

The tool is relevance. The mechanism is belonging. The Guest is a person with a life outside the four walls, and the operation's marketing goal is to insert itself into that life as a genuine part of it — through unique social interaction, through experiences worth having, through a connection that compounds visit after visit into something the Guest would not trade for a coupon.

The cost is relatively low. The ROI is relatively high. Not because Relationship Based Marketing is cheap to execute — it requires genuine investment in the architecture that produces the relationship — but because the returns compound over time while the costs do not. The Guest who returns because of the relationship does not require a discount to come back. The Guest who refers three others because of the relationship did not cost the operator a marketing dollar to acquire. The Guest who forgives a bad night because the relationship has depth is worth more than a full page ad in any publication.

Guests really do not want lower prices. They want better value. That is not a philosophical position. It is the operating reality of every operator who has built a genuine Guest relationship and tested what happens when they stop discounting. The Guest who came for the relationship stays for the relationship. The Guest who came for the deal leaves for the next one.

The Fork

Advertising is transactional. Branding is transformational. They are not two versions of the same tool. They produce two different Guests.

Transaction Based Marketing and Relationship Based Marketing are not interchangeable tools. They are not options the operator deploys situationally. They are roads — and the operator who tries to run both simultaneously is running neither correctly.

Transaction Based Marketing trains the Guest to wait for the deal. Relationship Based Marketing trains the Guest to come for the experience. The same Guest cannot be trained in both directions at the same time. The operator who runs a genuine relational marketing program and then drops a coupon into the same audience has told the Guest two contradictory things about what the operation is. The Guest resolves the contradiction by believing the cheaper one. The relationship work gets retroactively priced at the discount.

The fork is binary. TBM produces a commodity with a price-sensitive Guest base. RBM produces a differentiated operation with a relationship-loyal Guest base. Both compound — TBM toward the bottom, RBM toward the top. The operator chooses which compounding trajectory to run, by every marketing decision they make, whether they have named the choice or not.

Transactional brands offer the right product at the right price at the right time. People pay a fair price, they are not particularly loyal, and the relationship is completely rational.

Emotional brands create irrational relationships — irrational enthusiasm, irrational prices, Guests who ignore the competition, evangelists who proselytize with clothing, online reviews, and impassioned conversations around the dinner table.

Think about the relationship you have with your children. It isn't rational. They look better to you than to anyone else. They're cuter, funnier, smarter to you than to anyone else. That's the power a brand has when it shifts from a rational, transactional relationship to an emotional one. The Guest who is emotionally connected to your operation sees it the way a parent sees their child — better than anyone else does, more forgiving of its flaws, more enthusiastic in sharing it.

That is the Guest Road 2 produces. That is the Guest Road 1 cannot create regardless of how well it executes the transaction.

We Sell a Social Experience

The foundational error behind most restaurant marketing is treating the operation as a product business when it is a social experience business.

Retail sells products. The product is the thing. The store is where you get it. The marketing is about the product — its features, its price, its availability. That logic transfers cleanly from manufacturer to retailer to consumer. It does not transfer to the restaurant.

The restaurant does not sell food. It sells the experience of having food in a specific place, with specific people, in a specific environment, served by specific humans. The food is how the experience is delivered. It is not the experience itself. The Guest who had a transcendent meal alone at a bad table in a cold room with an indifferent server did not have a transcendent experience. The food was excellent. The social experience failed.

This is why retail marketing strategies do not work in food service. Coupons work in retail because the product is the thing and the price is the argument. Coupons in a restaurant sell the transaction and cheapen the experience — because the experience is the product and the coupon says the experience isn't worth full price. Every discount is the operator telling the Guest that the social experience they are about to have is worth less than the operation was charging for it.

Transaction Based Marketing borrowed from retail and applied it to a social experience business. The mismatch is structural. No execution improvement fixes a structural mismatch. The only fix is the road.

[TABLE AS IS]

Activation aims to get an immediate behavioral response — promotions, performance marketing, digital spend. It is good for short-term selling and ROIs can be high, but the effects don't last long and do little to foster long-term growth.

Brand building creates long-term memories, associations and habits that influence Guests for years. It requires broader reach and repeated exposure but the effects last longer and accumulate over time. Brand building reduces price sensitivity and increases margins.

Businesses need both. But brand building is always the primary driver. Short-term activation is never enough alone. Ten years of IPA Databank data confirms it: brand advertising achieves both short-term and long-term results. Sales activation alone delivers almost none of the long-term effects. The operator who only activates is renting traffic with no equity building underneath it.

The independent who builds brand before activating is compounding it.

What Changes Tomorrow

Name the last three marketing decisions your operation made — discounts, promotions, posts, emails, events, anything. For each one: was the goal to maximize a transaction or to deepen a relationship? If the honest answer is transaction, you are on Road 1 regardless of what the marketing said it was for. The road is determined by the goal, not the label.

Cross-fundamental note: connects to 1.1 — Two Roads (the Two Roads of Marketing is the marketing expression of the same fundamental choice — the road the operator is on determines every marketing instrument they use and every Guest relationship they produce) and 5.X — Profit (Transaction Based Marketing's full cost including the [Lost Opportunity Tax] is a Profit fundamental calculation — the operator who has never run the full cost of their promotional spend has never seen what the road is actually costing them).
